## Video Communication for People Who Are DeafBlind or Have Low-Vision

**myMMX DB is a communication app that enables DeafBlind and Low-Vision individuals to make and receive telephone calls using a Video Relay Service (VRS), or point-to-point using Real-Time Text (RTT). The myMMX DB app is available for iPhone and iPad.**

### Easy-to-Use with Full Access

myMMX DB was developed, designed and tested in cooperation with the DeafBlind community to ensure the reliability of each and all of its usability features. It has a clear and distinct interface and supports the full range of visual and non-visual accessibility features available on iOS. It is fully adaptable to a user's individual preferences, with large buttons, large informational text and minimal interactions needed to handle calls.

It is compatible with Zoom and VoiceOver in iOS. All buttons and labels have accessible names and accessibility descriptions, text colors, text size, background color and contrast can be adjusted. Also, all features can be connected to a braille reader through VoiceOver.

### Video and Text Capabilities With RTT

Real-time Text (RTT) is a standard for text communication. It has been defined by the Federal Communication Commission (FCC) as a replacement for TTY.

With the myMMX DB app, braille readers are able to read RTT at their own pace. The user can control the focus in the text area because the text does not move automatically when new text is transmitted.

## Adjustable to a More Comfortable Reading Experience for the User

During phone calls with myMMX DB, the text is transmitted with a minimum of 300ms (250ms for RTT) intervals. The text speed and presentation can be adjusted in the settings.

- Text can be buffered and delayed. This enables the user to read and scroll the text at their own pace.
- When the user starts to type, the cursor is moved to the end of the text.
